# Skin Cancer - Technical Report

## Details

Report ID : ccaabdcc-9101-4e1a-a9ae-34b30e8290bd

Image ID : ISIC_0033185

Date : 2026-10-23

## Model Prediction

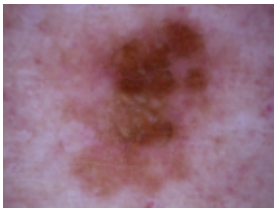

Predicted Skin Cancer Type: Benign keratosis-like lesion

Prediction Confidence: 90.90%

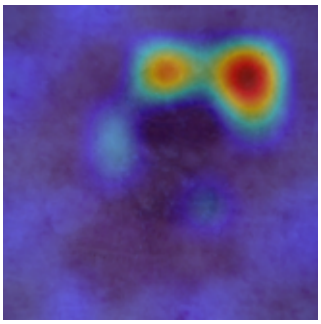

**Risk Level: LOW**

## Explainability Heatmaps

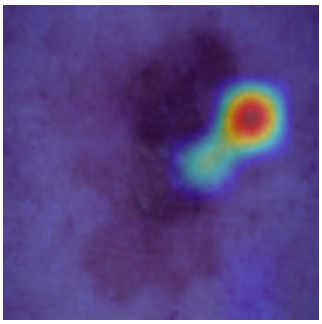

Input Image

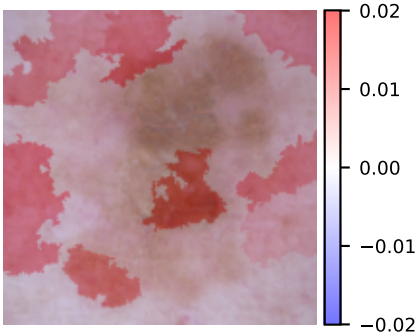

Grad-CAM: lesion view (Swin-T)

Grad-CAM: context view (MobileNetV3)

SHAP: lesion view

## Reason for Prediction

The model predicts Benign keratosis-like lesion (BKL) with 90.9% confidence. The next most likely classes are Melanocytic nevus (mole) (1.6%) and Basal cell carcinoma (1.5%).

Lesions of this class typically show sharply demarcated borders, waxy 'stuck-on' texture and milia-like cysts.

Evidence used by the model:

(1) The lesion branch (Swin-T) concentrated on the upper-right part of the lesion, with 5% of the crop at high activation and 27% of its attention inside the central region.

(2) The context branch (MobileNetV3) placed 17% of its attention on the surrounding skin.

(3) SHAP shows that 29% of the lesion regions push toward BKL, strongest in the central part.

Guardrail: confidence 90.9% (threshold 60%), normalised entropy 0.24 (threshold 0.60), so the case is accepted. Assigned risk level: Low.
